# Depression

## Symptoms or Behaviors
- Sleeping in class
- Defiant or disruptive
- Refusal to participate in activities
- Not turning in homework assignments, failing tests
- Excessive tardiness
- Fidgety or restless, distracting other students
- Isolating, quiet
- Frequent absences
- Failing grades
- Refusal to do school work and general non-compliance with rules
- Talks about dying or suicide

## About the Disorder
All children feel blue or sad at times, but feelings of sadness with great intensity that persist for weeks/months may be a symptom of major depressive disorder or dysthymic disorder (chronic depression). These disorders affect a young person’s thoughts, feeling, behavior, body and can lead to school failure, alcohol/drug abuse and even suicide.

Recent studies reported by USDHHS show that as many as 1 in every 33 children may have depression; among adolescents, the ratio may be as high as 1 in 8. Boys appear to suffer earlier in childhood. During adolescence, the illness is prevalent among girls. Depression is hard to diagnose, more difficult to treat, more severe, and more likely to reoccur than adult forms. Depression also affects a child’s development. A depressed child becomes “stuck” and unable to pass through normal developmental stages. Common symptoms are:

- Sadness that won’t go away
- Hopelessness
- Irritability
- School avoidance
- Changes in sleeping and eating patterns
- Frequent complaints of aches and pains
- Thoughts of death or suicide
- Self-deprecating remarks
- Persistent boredom, low energy, or poor concentration
- Increased activity

Students who used to enjoy playing with friends may now spend most of their time alone or they may start “hanging out” with a completely different peer group. Activities that were once fun hold no interest. They may talk about dying or suicide. Depressed teens may “self-medicate” with alcohol or drugs.

## Educational Implications
Students experiencing depression may display a marked change in their interest in schoolwork and activities. Their grades may drop significantly due to lack of interest, loss of motivation, or excessive absences. They may withdraw and refuse to socialize with peers or participate in group projects.

## Instructional Strategies & Classroom Accommodations
- Reduce some classroom pressures.
- Break tasks into smaller parts.
- Reassure students that they can catch up. Show them the steps they need to take and be flexible and realistic about your expectations. (School failures and unmet expectations can exacerbate the depression).
- Help students use realistic and positive statements about their performance and outlook for the future.
- Help students recognize and acknowledge positive contributions and performance.
- Depressed students may see issues in black and white terms- all bad or all good. It may help to keep a record of their accomplishments that you can show to them occasionally.
- Encourage gradual social interaction (i.e. small group work).
- Ask parents what would be helpful in the classroom to reduce pressure or motivate the child.

<td>Children who cause trouble at home or at school may actually be depressed, although they may not seem sad. Younger children may pretend to be sick, be overactive, cling to their parents, seem accident prone, or refuse to go to school. Older children and teens often refuse to participate in family and social activities and stop paying attention to their appearance. They may also be restless, grouchy, or aggressive. Most mental health professionals believe that depression has a biological origin. Research indicates that children have a greater chance of developing depression if one or both of their parents suffered from this illness.</td>
